Q Thought-provoking question:

If you finally find the dataset of any event/experiment that you've been searching for (say in csv format), do you think your job of analysing the data is done, just by performing operations (which we'll learn) on the computer? Are there any issues you could face? Give ideas.

No, there might be problems.

~~we~~ Our way of extracting data from the ~~system~~ database may be working good enough for our dataset but may crash of the system or make the system slow while working with large databases.

Our way of solving the problem may be too tedious and even ~~our~~ our systems may run out of memory.
